

Workshop MariaDB Windows

Agenda

1. Grundsätzliches

- [Historie MySQL/MariaDB](#)
- [MySQL vs. MariaDB](#)

2. Performance / Theorie - Aspekte der MariaDB - Architektur

- [Architektur Server \(Schritte\)](#)
- [CPU oder io-Last klären](#)
- [Storage Engines](#)
- [InnoDB - Struktur](#)
- [InnoDB - Optimierung](#)
- [Query - Cache](#)
- [3-Phasen-Datengröße](#)

3. Konfiguration

- [Slow query log](#)

4. Administration

- [Standard storage engine bestimmen](#)
- [Show status](#)
- [Server System Variablen - show variables](#)
- [User verwalten](#)

5. Backup und Restore

- [Wann binlog ?](#)
- [Backup with mysqldump - best practices](#)
- [PIT Exercise - point in time recovery](#)
- [Mariabackup](#)

6. Performance und Optimierung von SQL-Statements

- [Performance tmp disk tables problem](#)
- [Explain verwenden](#)
- [Do not use '*' whenever possible](#)
- [Indexes](#)
- [profiling-get-time-for-execution-of-query](#)
- [Kein function in where verwenden](#)
- [Optimizer-hints \(and why you should not use them\)](#)
- [Query-Plans aka Explains](#)
- [Query Pläne und die Key-Länge](#)
- [Index und Likes](#)
- [Index und Joins](#)
- [Find out cardinality without index](#)
- [Index and Functions](#)

7. Tools

- [Percona Toolkit](#)

- [pt-query-digest - analyze slow logs](#)
- [pt-online-schema-change howto](#)
- [Example sys-schema and Reference](#)

8. Beispieldaten

- [Verleihdatenbank - sakila](#)
- [Setup training data "contributions"](#)

9. Managing big tables

- [Using Partitions - Walkthrough](#)

10. Replication

- [Replikation mit GTID](#)
- [Replikation Read/Write - Split:](#)

11. Fragen und Antworten

- [Fragen und Antworten](#)

12. Projektarbeit/-optimierung

- [Praktisch Umsetzung in 3-Schritten](#)

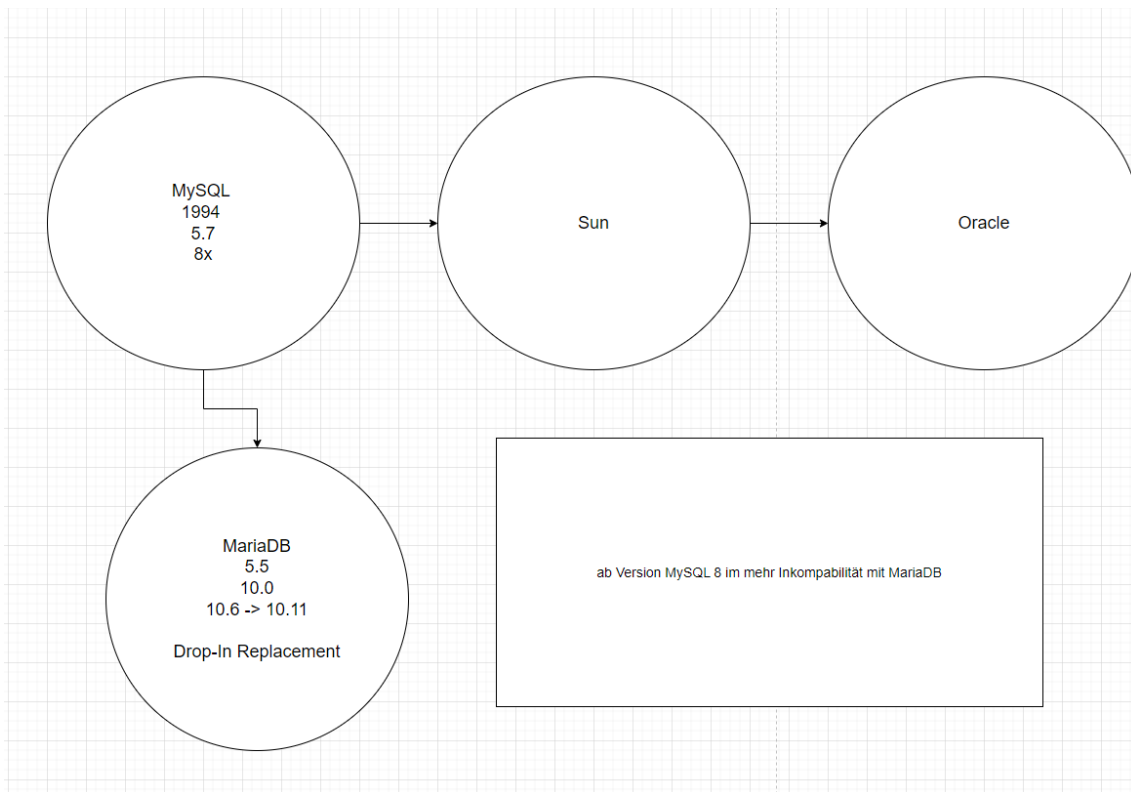

13. Dokumentation

- [MySQL - Performance - PDF](#)
- [Effective MySQL](#)

Grundsätzliches

Historie MySQL/MariaDB

Schaubild

MySQL vs. MariaDB

Was ist gleich ?

- Gleiche CodeBasis weil Kopie
- gleiche Tools (weitesgehend)

Was ist anders (MariaDB)?

- Andere Storage Engine sind möglich
- physische Onlinebackup ist mit drin in der Community Version (mariabackup)
 - ein absolutes Muss für grosse Datenbestände (Geschwindigkeit ist wesentlich schneller beim zurückspielen)
- Langsame Abfragen protokollieren lassen (hier habt ihr in MariaDB noch mehr Ausgabemöglichkeiten)

mysql/mariadb

- datenbank die gerade ausgewählt ist, wird angezeigt im Prompt

Was ist anders ? (MySQL)

- ab MySQL 8 - die Server Konfiguration während der Laufzeit setzen und persistent ändern

Performance / Theorie - Aspekte der MariaDB - Architektur

Architektur Server (Schritte)

CPU oder io-Last klären

```
top - 07:29:09 up 19:14, 1 user, load average: 0.00, 0.00, 0.00
Tasks: 69 total, 1 running, 68 sleeping, 0 stopped, 0 zombie
%Cpu(s): 0.3 us, 0.3 sy, 0.0 ni, 99.3 id, 0.0 wa, 0.0 hi, 0.0 si, 0.0 st
MiB Mem : 989.9 total, 273.7 free, 155.3 used, 560.8 buff/cache
MiB Swap: 0.0 total, 0.0 free, 0.0 used. 677.2 avail Mem
```

PID	USER	PR	NI	VIRT	RES	SHR	S	%CPU	%MEM	TIME+	COMMAND
1	root	20	0	104936	10296	7880	S	0.0	1.0	0:05.78	systemd
2	root	20	0	0	0	0	S	0.0	0.0	0:00.00	kthreadd
3	root	0	-20	0	0	0	I	0.0	0.0	0:00.00	rcu_gp
4	root	0	-20	0	0	0	I	0.0	0.0	0:00.00	rcu_par_gp
6	root	0	-20	0	0	0	I	0.0	0.0	0:00.00	kworker/0:0H+
8	root	0	-20	0	0	0	I	0.0	0.0	0:00.00	mm_percpu_wq
9	root	20	0	0	0	0	S	0.0	0.0	0:00.80	ksoftirqd/0
10	root	20	0	0	0	0	I	0.0	0.0	0:01.66	rcu_sched
11	root	20	0	0	0	0	I	0.0	0.0	0:00.00	rcu_bh
12	root	rt	0	0	0	0	S	0.0	0.0	0:00.30	migration/0
14	root	20	0	0	0	0	S	0.0	0.0	0:00.00	cpuhp/0
15	root	20	0	0	0	0	S	0.0	0.0	0:00.00	kdevtmpfs
16	root	0	-20	0	0	0	I	0.0	0.0	0:00.00	netns
17	root	20	0	0	0	0	S	0.0	0.0	0:00.02	kauditd
18	root	20	0	0	0	0	S	0.0	0.0	0:00.02	khungtaskd
19	root	20	0	0	0	0	S	0.0	0.0	0:00.00	oom_reaper

Fall 1

=====

CPU-gebundene Last: in Zeile CPU:

nur 'sy' und 'us' ist hoch

Fall 2:

=====

IO-gebundene Last

(d.h. egal, ob man eine bessere hat, es bringt nicht mehr,

weil die Festplatte entscheidend ist (in diesem Fall))

Die Festplatte ist hier der begrenzende Faktor

sy und wa hoch (wa = waiting, cpu wartet auf das io-subsystem (Festplatte or Storage))

Storage Engines

Why ?

Let's you choose:

How your data is stored

What ?

- Performance, features and other characteristics you want

Where ?

- Theoretically you can use a different engine for every table
- But: For performance optimization and future, it is better to concentrate on one

What do they do ?

- In charge for: Responsible for storing and retrieving all data stored in MySQL
- Each storage engine has its:
 - Drawbacks and benefits
- Server communicates with them through the storage engine API
 - this interface hides differences
 - makes them largely transparent at query layer
 - api contains a couple of dozen low-level functions e.g. "begin a transaction", "fetch the row that has this primary key"

Storage Engine do not

- Storage Engines do not parse SQL
- Storage Engines do not communicate with each other

They simply

- They simply respond to requests from the server

Which are the most important one ?

- InnoDB (currently default engine)
- MyISAM/Aria
- Memory
- CSV
- Blackhole (/dev/null)
- Archive
- Partition
- (Federated/FederatedX)

In Detail: MyISAM - Storage Engine

1. table locks → Locks are done table-wide
2. no automatic data-recovery (Aria hat das !)
3. you can loose more data on crashes than with e.g. InnoDB
4. no transactions
5. only indices are save in memory through MySQL
6. compact saving (data is saved really dense)
7. table scans are quick

In Detail: InnoDB - Storage Engine

1. support hot backups (because of transactions)
2. transactions are supported
3. foreign keys are supported
4. row-level locking
5. multi-versioning

InnoDB - Struktur

InnoDB - Optimierung

InnoDB buffer pool

- How much data fits into memory
- Free buffers = pages of 16 Kbytes
- Free buffer * 16Kbytes = free innodb buffer pool in KByte

How to find out ?

```
## OR:
MariaDB [(none)]> show status like '%free%';
+-----+-----+
| Variable_name          | Value  |
+-----+-----+
| Innodb_buffer_pool_pages_free | 48083  |
| Innodb_buffer_pool_wait_free  | 0      |
| Innodb_ibuf_free_list      | 0      |
| Qcache_free_blocks        | 1      |
| Qcache_free_memory        | 1031304 |
+-----+-----+
5 rows in set (0.002 sec)
```

show engine innodb status

```
## please use command line
show engine innodb status \G
```

Overview innodb server variables / settings

- <https://dev.mysql.com/doc/refman/5.7/en/innodb-parameters.html>

Change innodb_buffer_pool

```
## my.ini
## 70-80% of memory on dedicated mysql
[mysqld]
innodb-buffer-pool-size=6G

## Dienst neu starten

##
mysql
mysql>show variables like 'innodb%buffer%';
```

innodb_flush_method

Ideally O_DIRECT on Linux, but please test it, if it really works well.
- no changes needed in Windows as we are using unbuffered

innodb_flush_log_at_trx_commit

When is flushing done from innodb_log_buffer to log.
Default: 1 : After every commit
-> best performance 2. -> once per second

Good to use 2, if you are willing to loose 1 second of data on powerfail

innodb_flush_neighbors

on ssd disks set this to off, because there is no performance improvement
innodb_flush_neighbors=0

Default = 1

skip-name-resolv.conf

```
## work only with ip's - better for performance
/etc/my.cnf
skip-name-resolve
```

- <https://nixcp.com/skip-name-resolve/>

Calculate innodb-log-file-size

```
## in mysql client
pager more;
## Determine LSN from engine innodb status
## Log sequence number 21879482
show engine innodb status \G
select sleep(60);
## Determine LSN #
## Log sequence number 22279482
show engine innodb status \G
pager;
```

```
## letzter (2. Wert - 1.Wert)
mysql> select (3838334638 - 3836410803) / 1024 / 1024 as MB_per_min;
+-----+
| MB_per_min |
+-----+
| 1.83471203 |
+-----+
```

- <https://www.percona.com/blog/how-to-calculate-a-good-innodb-log-file-size/>

Ref:

- <https://dev.mysql.com/doc/refman/5.7/en/innodb-buffer-pool-resize.html>

Privileges for show engine innodb status

```
show engine innodb status \G
ERROR 1227 (42000): Access denied; you need (at least one of) the PROCESS privilege(s)
for this operation
```

Query - Cache

Defaults

- Default Value: OFF (>= MariaDB 10.1.7), ON (<= MariaDB 10.1.6)

Performance query cache

- Always try to optimize innodb with disabled query cache first (innodb_buffer_pool)
- If you use query_cache system can only use on CPU-Core. !!

How to enable query cache

```
## have_query_cache means compiled in mysql
## query_cache_type off means not enable by config
-- query cache is disabled
mysql> show variables like '%query_cache%';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| have_query_cache | YES |
| query_cache_limit | 1048576 |
| query_cache_min_res_unit | 4096 |
```

query_cache_size	1048576
query_cache_type	OFF
query_cache_wlock_invalidate	OFF

6 rows in set (0.01 sec)

```
root@trn01:/etc/mysql/mysql.conf.d# tail mysqld.cnf
```

```
[mysqld]
```

```
pid-file           = /var/run/mysqld/mysqld.pid
```

```
socket             = /var/run/mysqld/mysqld.sock
```

```
datadir            = /var/lib/mysql
```

```
log-error           = /var/log/mysql/error.log
```

```
## By default we only accept connections from localhost
```

```
bind-address        = 0.0.0.0
```

```
## Disabling symbolic-links is recommended to prevent assorted security risks
```

```
symbolic-links=0
```

```
query-cache-type=1
```

```
systemctl restart mysql
```

```
mysql> show variables like '%query_cache%';
```

Variable_name	Value
---------------	-------

have_query_cache	YES
------------------	-----

query_cache_limit	1048576
-------------------	---------

query_cache_min_res_unit	4096
--------------------------	------

query_cache_size	1048576
------------------	---------

query_cache_type	ON
------------------	----

query_cache_wlock_invalidate	OFF
------------------------------	-----

6 rows in set (0.01 sec)

```
mysql> show status like '%Qcache%';
```

Variable_name	Value
---------------	-------

Qcache_free_blocks	1
--------------------	---

Qcache_free_memory	1031832
--------------------	---------

Qcache_hits	0
-------------	---

Qcache_inserts	0
----------------	---

Qcache_lowmem_prunes	0
----------------------	---

Qcache_not_cached	0
-------------------	---

Qcache_queries_in_cache	0
-------------------------	---

Qcache_total_blocks	1
---------------------	---

8 rows in set (0.00 sec)

```
## status in session zurücksetzen.
```

```
mysql> flush status;
```

```
Query OK, 0 rows affected (0.00 sec)
```

Warum die Verwendung des Query Cache schlecht

```
TABELLE Mitarbeiter
Select * from Mitarbeiter -> query_cache
Nächste abfrage. Select * from Mitarbeiter
-> aus query_cache
Insert into Mitarbeiter
-> cache invalidiert -> kein Inhalt mehr
Select * from Mitarbeiter -> query_cache
```

Mutex:

-> bei Benutzung gesperrt

```
// dadurch können Schreibabfragen nur quasi sequentiell
A schreibt, B wartet bis A fertig ist, dann schreibt B
```

Nur Zeilensperrung

A schreibt, B schreibt auch, wenn nicht Genaue die gleichen Zeile

Query cache verhindert, dass mehrere Kerne der CPU von MySQL verwendet werden können.

-> lock-file im filesystem -> mutex -> mutual - exclusion.

Ich mache ein Lock-file damit du weißt, dass ich gerade
Daran arbeite.

3-Phasen-Datengröße

Phase 1: Table content is small (only some rows)

```
## table scan is quicker than index search
## e.g. 10 entries

## so eventually index is not needed
```

Phase 2: Index is good !!

```
## performance gain by using index
## Step 1: Obtaining id's from index (primary key id)
## Step 2: Retrieving data
```

Phase 3: Index is not improve performance / or would makes performance worse

```
Step 1: lookup in index:
1
70
1040
2100
```

```
35000
-> there is a lot of space (other rows) in between.
```

Step 2: Lookup data, but a lot lookups needed

```
-> random reads
-> So mysql might be better off to do a table scan.
```

Konfiguration

Slow query log

General

- Slow Query logs is activated with `slow_query_log` either in `my.ini` or as with `set global`
- But it only triggers when the time is given correctly
 - Default: 10 (only queries slower than 10 seconds are recorded)

Easiest way to activate during runtime

```
## in mysql - client
set global slow_query_log = 1;
show variables like '%slow%';
set global long_query_time=0.000001; # 0,5 Sekunden. Alles was >= 0,5 sekunden dauert,
wird geloggt
set session long_query_time=0.000001;
```

Logge alles wo kein Index verwendet werden kann (egal) wie langsam oder schnell

```
## damit er wirklich nur die queries logged, die keinen index haben, sollte. der
## long_query_time - Wert möglichst hoch sein.
set global long_query_time = 20
set session long_query_time = 20
set global slow_query_log = 1
set session slow_query_log = 1
set global log_queries_not_using_indexes = 1
set session log_queries_not_using_indexes = 1
```

Bitte `slow_query_log` bei der ausgabe geschätziger zu sein

```
set global log_slow_verbosity = 'query_plan,explain'
set session log_slow_verbosity = 'query_plan,explain'
```

Die Anzahl der Ausgabe reduzieren (nur jedes 5.)

```
### /etc/mysql/mariadb-conf.d/50-server.cnf und mysqld
log-slow-rate-limit=5;
```

Best - Practice - Phase 1

```
## Alle Logs analysieren, die kein Index verwendet
##/etc/mysql/mariadb.conf.d/50-server.cnf
## unter [mysqld]

## slow query log
slow-query-log
log-queries-not-using-indexes
log-slow-rate-limit=5
log-slow-verbosity = 'query_plan,explain'
```

Ref:

- <https://mariadb.com/kb/en/slow-query-log-overview/>

Administration

Standard storage engine bestimmen

Die Standard-Storage wird über die Server-System-Variable `default_storage_engine` festgelegt.

Wenn beim Erstellen einer Tabelle keine storage-engine angegeben wird, wird diese verwendet .

(In Datenbanken/Schemas kann man KEINE Storage engine festlegen)

```
mysql>show variables like 'default_storage_engine';
```

Show status

with mysql -> show status

```
mysql> show status;
-- global status für den gesamten Server seit er läuft
mysql> show global status;
mysql> # setzt session status zurück
mysql> flush status;
mysql> show status;
```

Spezielle status variablen

```
show status like 'Com%';
show status like 'Com_select ';
```

Aus information_schema

```
select * from information_schema.global_status;
select * from information_schema.session_status;
```

Server System Variablen - show variables

```
show variables;
show global variables;
show variables like 'innodb%';
show global variables like 'innodb%';
```

```
## @@ steht für Server System Variable
select @@innodb_flush_method
```

User verwalten

```
## bitte nur im Notfall von überall
## + passworrr im klartext
mysql>create user training@'%' identified by 'meingeheimespasswort'
mysql>create user training@192.168.2.2; -- von einer bestimmten ip ausschliesslich //
ip des zugreifers

## Rechte vergeben *.* -> alle datenbanken.alles tabellen
## to -> für.
mysql>grant all on *.* to training@192.168.2.2
## Rechte entziehen
mysql>revoke select on *.* from training@192.168.2.2
## oder alle Rechte enziehen
mysql>revoke all on *.* from training@192.168.2.2

## Rechte eines Benutzers anschauen
mysql>show grants for training@192.168.2.2. // genaue Kombination muss angegeben
werden

## Eigentlich nicht notwendig, aber geht
mysql>select * from mysql.global_priv \G # das geht nur im mysql-client und zeigt
Spalten in Zeilen an
mysql>select * from mysql.user;
```

Backup und Restore

Wann binlog ?

Auflistung

- Replication
- Point in Time Recovery

Backup with mysqldump - best practices

Dumping (best option) without active binary log

```
mysqldump -uroot -p<password-for-root> --all-databases --single-transaction > all-
databases
## if you want to include procedures use --routines
```

```
## with event - scheduled tasks
mysqldump -uroot -p<password-for-root> --all-databases --single-transaction --routines
--events > all-databases.sql
```

Useful options for PIT

```
## -quick not needed, because included in -opt which is enabled by default

## on local systems using socket, there are no huge benefits concerning --compress
## when you dump over the network use it for sure
mysqldump --all-databases --single-transaction --gtid --master-data=2 --routines --
events --flush-logs > /usr/src/all-databases.sql;
```

With PIT_Recovery you can use --delete-master-logs

- All logs before flushing will be deleted

```
mysqldump --all-databases --single-transaction --gtid --master-data=2 --routines --
events --flush-logs --delete-master-logs > /usr/src/all-databases.sql;
```

Flush binary logs from mysql

```
mysql -e "PURGE BINARY LOGS BEFORE '2013-04-22 09:55:22';"
```

Version with zipping

```
mysqldump --all-databases --single-transaction --gtid --master-data=2 --routines
--events --flush-logs --compress | gzip > /usr/src/all-databases.sql.gz
```

Performance Test mysqldump (1.7 Million rows in contributions)

```
date; mysqldump --all-databases --single-transaction --gtid --master-data=2 --routines
--events --flush-logs --compress > /usr/src/all-databases.sql; date
Mi 20. Jan 09:40:44 CET 2021
Mi 20. Jan 09:41:55 CET 2021
```

Seperated sql-structure files and data-txt files including master-data for a specific database

```
# backups needs to be writeable for mysql
mkdir /backups
chmod 777 /backups
chown mysql:mysql /backups
mysqldump --tab=/backups contributions
mysqldump --tab=/backups --master-data=2 contributions
mysqldump --tab=/backups --master-data=2 contributions > /backups/master-data.tx
```

Created new database base on sakila database

```
## im Sicherungsverzeichnis
mysqldump -uroot -p sakila > sakila-all.sql
mysql -uroot -p -e "create database mynewdb"
mysql -uroot -p mynewdb < sakila-all.sql
```

PIT Exercise - point in time recovery

Problem coming up

```
## Step 1 : Create full backup (assuming 24:00 o'clock) in the backup folder
mysqldump -uroot -p --all-databases --single-transaction --gtid --master-data=2 --
routines --events --flush-logs --delete-master-logs > all-databases.sql

## Step 2: Working on data
mysql>use sakila;
mysql>insert into actor (first_name,last_name) values ('john','The Rock');
mysql>insert into actor (first_name,last_name) values ('johanne','Johannson');
## Step 2.5
## Auf welcher Position steht das master - binlog
mysql>show master status;

## Optional: Step 3: Looking into binary to see this data
## im Datenverzeichnis
## last binlog
mysqlbinlog -vv mariadb-bin.000005

## Step 4: Some how a guy deletes data
mysql>use sakila; delete from actor where actor_id > 200;
## now only 200 datasets
mysql>use sakila; select * from actor;
```

Fixing the problem

```
## find out the last binlog
## Simple take the last binlog

## IN THE DATA FOLDER
## Find the position where the problem occurred
mysqlbinlog -vv mysqld-bin.000005
## and create a recover.sql - file (before apply full backup)
mysqlbinlog -vv --stop-position=857 mysqld-bin.000005 > recover.sql
move recover.sql C:\Users\vgh-MariaDB\Desktop\recover.sql
## in case of multiple binlog like so:
## Alle Binärlogs seit dem letzten Backup
## mysqlbinlog -vv --stop-position=857 mysqld-bin.000004 mysqld-bin.000005 >
recover.sql

## Step 1: Apply full backup
## im backup ordner
## In das Backup-Verzeichnis wechseln
```

```
cd C:\Users\vgh-MariaDB\Desktop\  
mysql -uroot -p < all-databases.sql
```

```
mysql -uroot -p -e "select * from actor;" sakila  
  
-- im mysql-client durch eingeben des Befehls 'mysql'  
-- should be 200 or 202#  
use sakila; select * from actor;
```

```
## auf der Kommandozeile  
mysql -uroot -p < recover.sql
```

```
-- im mysql-client durch eingeben des Befehls 'mysql'  
-- should be 202  
use sakila; select * from actor;
```

Mariabackup

Installation

Is done through MSI-Installer for MariaDB-Server

Backup Walkthrough (Windows)

Schritt 1: Backup erstellen

```
## in der cmd.exe  
## Backupfolder  
cd C:\Users\vgh-MariaDB  
md Backups  
  
# target-dir needs to be empty or not present  
mariabackup -uroot -p<password for root> --target-dir=Backups/20230321 --backup
```

Schritt 2: Prepare durchführen (Änderung für Tablespaces anwenden)

```
## apply ib_logfile0 to tablespaces  
## after that ib_logfile0 -> 0 bytes  
mariabackup --target-dir=Backups/20230321 --prepare
```

Recover Walkthrough

1. Dienst mariadb stoppen

2. Im Datenverzeichnis - altes Datenverzeichnis verschieben
cd C:\Program Files\MariaDB 10.6\
rename data data.bkup

```
3. In das Elternverzeichnis von backup wechseln
cd C:\Users\vgh-MariaDB
mariabackup --target-dir=Backups/20230321 --copy-back
3.5 my.ini in data - ordner reinkopieren (aus data.bkup ordner)
4. Rechte anpassen (NT Service\MariaDB) für den Ordner data -> Vollzugriff
5. Dienst mariadb starten
```

Performance und Optimierung von SQL-Statements

Performance tmp_disk_tables problem

Warum ?

Temporäre Tabellen die auf die Platte geschrieben
create_tmp_disk_tables sind generell für die Performance schlecht

Wie kann ich herausfinden, ob das bei mir auf meinem Server der Fall ist ?

```
show global status like '%Created_tmp_disk_tables%';
show global status like '%Created_tmp_files%';
```

Wie kann ich herausfinden, welche Queries das genau sind ?

- Information steht bei mariadb im slow_query_log

Explain verwenden

Einfacher Fall

```
explain select * from actor
```

Erweiterter Fall

```
explain extended select * from user
show warnings
```

Anzeigen der Partitions

```
explain partitions select * from actor
```

Ausgabe im JSON-Format

```
## Hier gibt es noch zusätzliche Informationen
explain format=json select * from actor
```

Do not use '*' whenever possible

Why ?

- You are adding .. to the server:

- I/O
- memory
- CPU
- You are preventing covering indexes

Walkthrough. (Look at the time)

Using '*'

```
## using '*'
pager grep "rows in set";
select * from donors where last_name like 'Willia%'; select * from donors where
last_name like 'Willia%';
-- time between 0.02 and 0.04 secs
-- 2424 rows in set (0.02 sec)
-- reset pager
pager
```

```
## corresponding Explain (QEP)
explain select * from donors where last_name like 'Willia%';
+---+-----+-----+-----+-----+-----+-----+
--+-----+-----+-----+-----+-----+-----+
| id | select_type | table | partitions | type | possible_keys | key |
| key_len | ref | rows | filtered | Extra |
+---+-----+-----+-----+-----+-----+-----+
--+-----+-----+-----+-----+-----+-----+
| 1 | SIMPLE | donors | NULL | range | donors_donor_info |

```

- Uses cover index (indicator in Extra: using index)

Ref:

- <https://www.oreilly.com/library/view/high-performance-mysql/9780596101718/ch04.html>

Indexes

Avoid ALL

- is the worst type : TABLE SCAN (Need to go through all rows)

```
mysql> create table actor4 as select * from actor;
mysql> explain select * from actor4 where actor_id > 10;
+----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
--+-----+-----+-----+-----+
| id | select_type | table | partitions | type | possible_keys | key | key_len | ref |
| rows | filtered | Extra |
+----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
--+-----+-----+-----+-----+
| 1 | SIMPLE | actor4 | NULL | ALL | NULL | NULL | NULL | NULL |
NULL | 200 | 33.33 | Using where |
+----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
--+-----+-----+-----+-----+
1 row in set, 1 warning (0.00 sec)
```

Cover Index.

- We can get all the necessary information from the index (no acces of filesystem necessary)

```
drop table if exists actor2;
create table actor2 as select * from actor;
create index idx_actor2_last_name on actor2 (last_name);

## using index
## <- indicates that a cover index is used

mysql> explain select last_name from actor2 where last_name like 'B%';
+----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
--+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| id | select_type | table | partitions | type | possible_keys | key | key_len | ref |
| key_len | ref | rows | filtered | Extra |
+----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
--+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| 1 | SIMPLE | actor2 | NULL | range | idx_actor2_last_name | idx_actor2_last_name | 182 | NULL |
idx_actor2_last_name | 182 | NULL | 22 | 100.00 | Using where; Using index |
+----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
--+-----+-----+-----+-----+
1 row in set, 1 warning (0.00 sec)
```

Creating a primary index

```
create index primary key on actor2 (actor_id)
explain select actor_id from actor2 where actor_id > 2
```

Using an index for last_name

```
drop table if exists actor2;
create table actor2 as select * from actor;
create index idx_actor2_last_name on actor2 (last_name);
explain select * from actor2 where last_name like 'B%';
```

id	select_type	table	partitions	type	possible_keys	key
1	SIMPLE	actor2	NULL	range	idx_actor2_last_name	idx_actor2_last_name

```
1 row in set, 1 warning (0.00 sec)
```

Never use a function in where

Why ?

```
Step 1: MySQL needs to retrieve every row
Step 2: run function
--> so, no index can be used
```

Example

```
drop table if exists actor2;
create table actor2 as select * from actor;
create index idx_actor2_last_name on actor2 (last_name);
explain select * from actor2 where last_name like
concat(substring(first_name,1,1),'%');
```

Index is always read from left to right

```
## so the index cannot be used if we ask for last_name
drop table if exists actor2;
create table actor2 as select * from actor;
create index idx_actor2_first_name_last_name on actor2 (first_name,last_name);
explain select * from actor2 where last_name like 'B%';
##
explain select * from actor2 where first_name like 'B%';
```

profiling-get-time-for-execution-of.query

- Get better values, how long queries take

Example

```
set profiling = 1
-- Step 2 - Execute query
select last_name as gross from donors where last_name like lower('WILLI%')

## Step 3 - Show profiles
show profiles;
+-----+-----+-----+
+-----+
| Query_ID | Duration | Query
|
+-----+-----+-----+
+-----+
|          1 | 0.01993525 | select last_name as gross from donors where last_name like
lower('WILLI%') |
4 rows in set, 1 warning (0.00 sec)

## Step 4 - Show profile for a specific query
mysql> show profile for query 1;
+-----+-----+
| Status | Duration |
+-----+-----+
| starting | 0.000062 |
| checking permissions | 0.000006 |
| Opening tables | 0.000021 |
| init | 0.000017 |
| System lock | 0.000007 |
| optimizing | 0.000007 |
| statistics | 0.000083 |
| preparing | 0.000012 |
| executing | 0.000004 |
| Sending data | 0.022251 |
| end | 0.000005 |
| query end | 0.000008 |
| closing tables | 0.000007 |
| freeing items | 0.001792 |
| cleaning up | 0.000016 |
+-----+-----+
15 rows in set, 1 warning (0.00 sec)
```

Kein function in where verwenden

1. No function in where (column_name)

```
## Never use a function for the column name in where
## e.g.
select * from donors where upper(last_name) like 'Willia%'
```

Why ?

- Not index can be used

```
## Not filtering possible by indx -> possible_keys -> NULL
explain select last_name from donors where upper(last_name) like 'WILLI%';
+----+-----+-----+-----+-----+-----+-----+-----+
+-----+-----+-----+-----+-----+-----+-----+-----+
| id | select_type | table | partitions | type | possible_keys | key |
key_len | ref | rows | filtered | Extra |
+----+-----+-----+-----+-----+-----+-----+-----+
+-----+-----+-----+-----+-----+-----+-----+-----+
| 1 | SIMPLE | donors | NULL | index | NULL | donors_donor_info |
687 | NULL | 701948 | 100.00 | Using where; Using index |
+----+-----+-----+-----+-----+-----+-----+-----+
+-----+-----+-----+-----+-----+-----+-----+-----+
1 row in set, 1 warning (0.00 sec)
```

Optimizer-hints (and why you should not use them)

Tell the optimizer what to do and what not to do

- <https://dev.mysql.com/doc/refman/5.7/en/optimizer-hints.html#optimizer-hints-syntax>

Query-Plans aka Explains

- Query Plans are the same as Query Execution Plans (QEP's)
- You will see the Query Plan's with explain

Example

```
mysql> explain select * from recipients where recipient_id > 1 and recipient_id < 5;
+----+-----+-----+-----+-----+-----+-----+-----+
+-----+-----+-----+-----+-----+-----+-----+-----+
| id | select_type | table | partitions | type | possible_keys | key |
key_len | ref | rows | filtered | Extra |
+----+-----+-----+-----+-----+-----+-----+-----+
+-----+-----+-----+-----+-----+-----+-----+-----+
| 1 | SIMPLE | recipients | NULL | range | PRIMARY | PRIMARY | 4
| NULL | 1 | 100.00 | Using where |
+----+-----+-----+-----+-----+-----+-----+-----+
+-----+-----+-----+-----+-----+-----+-----+-----+
1 row in set, 1 warning (0.01 sec)
```

Output-Format json

```
-- includes costs
EXPLAIN format=json SELECT * from audit_log WHERE yr in (2011,2012);
```

Select_Type

- simple = one table

Types (in order of performance)

system

Only one row in table is present (only one insert)

const only one result

```
EXPLAIN select contribution_id from contributions where contribution_id = 262611;
+----+-----+-----+-----+-----+-----+-----+-----+
| id | select_type | table           | partitions | type   | possible_keys | key       |
key_len | ref  | rows | filtered | Extra           |
+----+-----+-----+-----+-----+-----+-----+-----+
| 1 | SIMPLE      | contributions   | NULL       | const  | PRIMARY      | PRIMARY   | 4
| const | 1 | 100.00 | Using index |
+----+-----+-----+-----+-----+-----+-----+-----+
1 row in set, 1 warning (0.00 sec)
```

ALL - Full table scan. (slowest)

```
EXPLAIN select * from contributions where vendor_last_name like 'W%';
+----+-----+-----+-----+-----+-----+-----+-----+
| id | select_type | table           | partitions | type   | possible_keys | key       |
key_len | ref  | rows | filtered | Extra           |
+----+-----+-----+-----+-----+-----+-----+-----+
| 1 | SIMPLE      | contributions   | NULL       | ALL    | NULL         | NULL      | NULL
| 2028240 | 11.11 | Using where |
+----+-----+-----+-----+-----+-----+-----+-----+
1 row in set, 1 warning (0.00 sec)
```

Extra

Using index - cover index is used

Looking data in index is sufficient
- no lookup of data on disk is necessary

```
mysql> EXPLAIN select contribution_id from contributions where contribution_id =
262611;
+----+-----+-----+-----+-----+-----+-----+-----+
| id | select_type | table           | partitions | type   | possible_keys | key       |
key_len | ref  | rows | filtered | Extra           |
+----+-----+-----+-----+-----+-----+-----+-----+
| 1 | SIMPLE      | contributions   | NULL       | const  | PRIMARY      | PRIMARY   | 4
| const | 1 | 100.00 | Using index |
+----+-----+-----+-----+-----+-----+-----+-----+
1 row in set, 1 warning (0.00 sec)

mysql> show warnings;
```

```

+-----+-----+-----+
| Level | Code | Message
|
+-----+-----+-----+
| Note  | 1003 | /* select#1 */ select '262611' AS `contribution_id` from
`contributions`.`contributions` where 1 |
+-----+-----+-----+
1 row in set (0.00 sec)

```

Query Pläne und die Key-Länge

Index und Likes

1. like 'Will%' - Index works

explain select last_name from donors where last_name like 'Will%';

2. like '%iams' - Index does not work

```

-- because like starts with a wildcard
explain select last_name from donors where last_name like '%iams';

```

3. How to fix 3, if you are using this often ?

```

## Walkthrough
## Step 1: modify table
alter table donors add last_name_reversed varchar(70) GENERATED ALWAYS AS
(reverse(last_name));
create index idx_last_name_reversed on donors (last_name_reversed);

## besser - Variante 2 - untested
alter table donors add last_name_reversed varchar(70) GENERATED ALWAYS AS
(reverse(last_name)), add index idx_last_name_reversed on donors (last_name_reversed);

## Step 2: update table - this take a while
update donors set last_name_reversed = reversed(last_name)
## Step 3: work with it
select last_name,last_name_reversed from donor where last_name_reversed like
reverse('%iams');

## Version 2 with pt-online-schema-change

```

Index und Joins

Take a look which order the optimizer uses

With date

```
-- Using a date which has no index
-- Needs to do a table scan
explain select c.* from contributions c join donors d using (donor_id) join recipients
r using (recipient_id) where c.date_recieved > '1999-12-01' and c.date_recieved <
'2000-07-01';
```

id	select_type	table	partitions	type	possible_keys	key
1	SIMPLE	c	NULL	ALL	donor_idx,recipient_idx	NULL
1	SIMPLE	r	NULL	eq_ref	PRIMARY	PRIMARY
1	SIMPLE	d	NULL	eq_ref	PRIMARY	PRIMARY

3 rows in set, 1 warning (0.00 sec)

60626 rows in set (7.22 sec)

With date and filter on donor

```
explain select c.*,d.last_name from contributions c join donors d using (donor_id)
join recipients r using (recipient_id)
where c.date_recieved > '1999-12-01' and c.date_recieved < '2000-07-01' and
d.last_name like 'A%';
```

id	select_type	table	partitions	type	possible_keys	key
1	SIMPLE	d	NULL	range	PRIMARY,donors_donor_info	
1	SIMPLE	c	NULL	ref	donor_idx,recipient_idx	
1	SIMPLE	r	NULL	eq_ref	PRIMARY	PRIMARY

3 rows in set, 1 warning (0.00 sec)

With date and filter on donor, less specific

```
select c.*,d.* from contributions c join donors d using (donor_id) join recipients r
using (recipient_id) where c.date_recieved > '1999-12-01' and c.date_recieved < '2000-
07-01' and d.last_name like 'A%';

explain select c.*,d.* from contributions c join donors d using (donor_id) join
recipients r using (recipient_id) where c.date_recieved > '1999-12-01' and
c.date_recieved < '2000-07-01' and d.last_name like 'A%';
+----+-----+-----+-----+-----+-----+-----+-----+
-----+-----+-----+-----+-----+-----+-----+-----+
-----+
| id | select_type | table | partitions | type  | possible_keys          | key
| key_len | ref          | rows  | filtered | Extra          |
+----+-----+-----+-----+-----+-----+-----+-----+
-----+-----+-----+-----+-----+-----+-----+-----+
-----+
| 1 | SIMPLE      | d      | NULL       | range | PRIMARY,donors_donor_info |

+----+-----+-----+-----+-----+-----+-----+-----+
-----+-----+-----+-----+-----+-----+-----+-----+
-----+
3 rows in set, 1 warning (0.00 sec)
```

With date and filter on donor and filter on recipient

```
mysql> explain select c.*,d.last_name,r.* from contributions c join donors d using
(donor_id) join recipients r using (recipient_
id) where c.date_recieved > '1999-12-01' and c.date_recieved < '2000-07-01' and
d.last_name like 'A%' and r.name like 'Cit%';
+----+-----+-----+-----+-----+-----+-----+-----+
-----+-----+-----+-----+-----+-----+-----+-----+
-----+
| id | select_type | table | partitions | type  | possible_keys          | key
| key_len | ref          | rows  | filtered | Extra          |
+----+-----+-----+-----+-----+-----+-----+-----+
-----+-----+-----+-----+-----+-----+-----+-----+
-----+
| 1 | SIMPLE      | r      | NULL       | ALL   | PRIMARY                | NULL
| NULL    | NULL         | 6063 | 11.11 | Using where |
| 1 | SIMPLE      | c      | NULL       | ref   | donor_idx,recipient_idx  |
recipient_idx | 5        | contributions.r.recipient_id | 305 | 11.11 | Using where
|
| 1 | SIMPLE      | d      | NULL       | eq_ref | PRIMARY,donors_donor_info | PRIMARY
| 4      | contributions.c.donor_id | 1 | 9.39 | Using where |
+----+-----+-----+-----+-----+-----+-----+-----+
-----+-----+-----+-----+-----+-----+-----+-----+
-----+
```

```
3 rows in set, 1 warning (0.00 sec)
```

Find out cardinality without index

Find out cardinality without creating index

```
select count(distinct donor_id) from contributions;
```

```
select count(distinct(vendor_city)) from contributions;
```

```
+-----+
| count(distinct(vendor_city)) |
+-----+
|                               | 1772 |
+-----+
1 row in set (4.97 sec)
```

Index and Functions

No index can be used on an index:

```
explain select * from actor where upper(last_name) like 'A%';
```

```
+---+-----+-----+-----+-----+-----+-----+-----+
+-----+-----+-----+
| id | select_type | table | partitions | type | possible_keys | key | key_len | ref |
| rows | filtered | Extra      |
+---+-----+-----+-----+-----+-----+-----+-----+
+-----+-----+-----+
| 1 | SIMPLE      | actor | NULL        | ALL  | NULL          | NULL | NULL    | NULL |
| 200 | 100.00 | Using where |
+---+-----+-----+-----+-----+-----+-----+-----+
+-----+-----+-----+
```

Workaround with virtual columns (possible since mysql 5.7)

```
## 1. Create Virtual Column with upper
alter table sakila add idx_last_name_upper varchar(45) GENERATED ALWAYS AS
upper(last_name);
## 2. Create an index on that column
create index idx_last_name_upper on actor (last_name_upper);
```

Workaround with persistent/virtual columns (MariaDB)

```
mysql> alter table actor add column last_name_upper varchar(45) as (upper(last_name))
PERSISTENT ;
mysql> insert into actor (first_name,last_name,last_name_upper) values
('Max','Mustermann','MUSTERMANN');
mysql> select * from actor order by actor_id desc limit 1;
mysql> -- setting index
mysql> create index idx_last_name_upper on actor (last_name_upper);
```

```
Query OK, 0 rows affected (0.007 sec)
Records: 0 Duplicates: 0 Warnings: 0
mysql> -- to use index we need to avoid the function in where
mysql> explain select * from actor where last_name_upper like 'WI%' \G
```

Reference:

- <https://dev.mysql.com/doc/refman/5.6/en/innodb-online-ddl.html>

Now we try to search the very same

```
explain select * from actor where last_name_upper like 'A%';
+----+-----+-----+-----+-----+-----+-----+-----+
| id | select_type | table | partitions | type | possible_keys | key |
| key_len | ref | rows | filtered | Extra |
+----+-----+-----+-----+-----+-----+-----+
| 1 | SIMPLE | actor | NULL | range | idx_last_name_upper |
idx_last_name_upper | 183 | NULL | 7 | 100.00 | Using where |
+----+-----+-----+-----+-----+-----+-----+
1 row in set, 1 warning (0.00 sec)
```

Tools

Percona Toolkit

Walkthrough (Windows)

```
## 1. Install strawberry perl
https://strawberryperl.com/

## 2. Download pt-query-digest and save with .pl suffix
https://www.percona.com/get/pt-query-digest

## 3. copy file to bin - folder of mariadb

## 4. Open mariadb Command Prompt
## Navigate to data - dir

## 5. as Admin: Execute once to get right connection to perl
pt-query-digest.pl <name of slow query log > analyse.txt

## 6. once more 5.
pt-query-digest.pl <name of slow query log > analyse.txt

## 7. Digest analyse.txt and be happy or not ;o)

## Referenz
## http://www.jonathanlevin.co.uk/2012/01/query-digest-on-windows.html
```

```
sudo apt update; sudo apt install -y wget gnupg2 lsb-release curl; cd /usr/src; wget
https://repo.percona.com/apt/percona-release_latest.generic_all.deb; dpkg -i percona-
release_latest.generic_all.deb; apt update; apt install -y percona-toolkit
```

pt-query-digest - analyze slow logs

Requires

- Install percona-toolkit

Usage

```
## first enable slow_query_log
set global slow_query_log = on
set global long_query_time = 0.2
## to avoid, that i have to reconnect with new session
set session long_query_time = 0.2

## produce slow query - for testing
select * from contributions where vendor_last_name like 'W%';
mysql > quit

##
cd /var/lib/mysql
## look for awhile with -slow.log - suffix
pt-query-digest mysql-slow.log > /usr/src/report-slow.txt
less report-slow.txt
```

pt-online-schema-change howto

Requirements

- Install percona-toolkit

Documentation

- <https://www.percona.com/doc/percona-toolkit/3.0/pt-online-schema-change.html>

What does it do ?

```
## Altering table without blocking them
## Do a dry-run beforehand
pt-online-schema-change --alter "ADD INDEX idx_city (city)" --dry-run
D=contributions,t=donors
##
pt-online-schema-change --alter "ADD INDEX idx_city (city)" --execute
D=contributions,t=donors
```

With foreign - keys

```
# first try
pt-online-schema-change --alter "add column remark varchar(150)" D=sakila,t=actor --
alter-foreign-keys-method=auto --dry-run
```

```
# then run
pt-online-schema-change --alter "add column remark varchar(150)" D=sakila,t=actor --
alter-foreign-keys-method=auto --execute
```

Example sys-schema and Reference

Install under mariadb 10.5

```
apt install git
cd /usr/src
git clone https://github.com/jmetzger/mariadb-sys.git
cd mariadb-sys
mysql < ./sys_10.sql
```

Examples

```
mysql> select * from sys.host_summary\G
***** 1. row *****
          host: localhost
      statements: 1347
statement_latency: 7.55 m
statement_avg_latency: 336.50 ms
      table_scans: 15
        file_ios: 612857
      file_io_latency: 1.66 m
current_connections: 1
    total_connections: 7
      unique_users: 1
      current_memory: 0 bytes
total_memory_allocated: 0 bytes
1 row in set (0.01 sec)
```

Ref:

- <https://github.com/mysql/mysql-sys/blob/master/README.md>

Beispieldaten

Verleihdatenbank - sakila

```
cd /usr/src
wget https://downloads.mysql.com/docs/sakila-db.tar.gz
tar xzvf sakila-db.tar.gz

cd sakila-db
mysql < sakila-schema.sql
mysql < sakila-data.sql
```

Setup training data "contributions"

Walkthrough (Debian/Ubuntu)

- Complete process takes about 10 minutes

```
cd /usr/src;
apt update; apt install git;
git clone https://github.com/jmetzger/dedupe-examples.git;
cd dedupe-examples;
cd mysql_example;
## Eventually you need to enter (in mysql_example/mysql.cnf)
## Only necessary if you cannot connect to db by entering "mysql"
## password=<your_root_pw>
./setup.sh
```

Managing big tables

Using Partitions - Walkthrough

Walkthrough

```
##
## EXPLAIN PARTITIONS
##
DROP TABLE IF EXISTS audit_log;
CREATE TABLE audit_log (
  yr      YEAR NOT NULL,
  msg     VARCHAR(100) NOT NULL)
ENGINE=InnoDB
PARTITION BY RANGE (yr) (
  PARTITION p0 VALUES LESS THAN (2010),
  PARTITION p1 VALUES LESS THAN (2011),
  PARTITION p2 VALUES LESS THAN (2012),
  PARTITION p3 VALUES LESS THAN MAXVALUE);
INSERT INTO audit_log(yr,msg) VALUES (2005,'2005'),(2006,'2006'),(2011,'2011'),
(2020,'2020');
EXPLAIN PARTITIONS SELECT * from audit_log WHERE yr in (2011,2012)\G
```

Example with years

```
CREATE TABLE audit_log2 ( yr      YEAR NOT NULL, msg     VARCHAR(100) NOT NULL)
ENGINE=InnoDB PARTITION BY RANGE (yr) ( PARTITION p2009 VALUES LESS THAN (2010),
PARTITION p2010 VALUES LESS THAN (2011), PARTITION p2011 VALUES LESS THAN (2012),
PARTITION p_current VALUES LESS THAN MAXVALUE);
INSERT INTO audit_log2(yr,msg) VALUES (2005,'2005'),(2006,'2006'),(2011,'2011'),
(2012,'2012');

EXPLAIN PARTITIONS SELECT * from audit_log2 WHERE yr = 2012;

ALTER TABLE audit_log2 REORGANIZE PARTITION p_current INTO (
  PARTITION p2012 VALUES LESS THAN (2013),
  PARTITION p_current VALUES LESS THAN MAXVALUE);
)
```

```
-- Where is data now saved
EXPLAIN PARTITIONS SELECT * from audit_log2 WHERE yr = 2012;
```

Eine bestehende große Tabelle partitionieren (mariadb)

```
Variante 1:
## Wichtig vorher Daten sichern

ALTER TABLE `audit_log3` PARTITION BY RANGE (`yr`) ( PARTITION p2009 VALUES LESS THAN
(2010) ENGINE=InnoDB, PARTITION p2010 VALUES LESS THAN (2011) ENGINE=InnoDB, PARTITION
p2011 VALUES LESS THAN (2012) ENGINE=InnoDB, PARTITION p2012 VALUES LESS THAN (2013)
ENGINE=InnoDB, PARTITION p_current VALUES LESS THAN MAXVALUE ENGINE=InnoDB )

Variante 2:
Daten ausspielen ohne create (dump) + evtl zur sicherheit Struktur-Dump
Tabelle löschen
Daten ohne Struktur einspielen
```

Fragen und Antworten

Fragen und Antworten

1. Archive Data

```
https://www.percona.com/doc/percona-toolkit/LATEST/pt-archiver.html
```

2. Does innodb do defragmentation by itself ?

```
## Some background while doing research.
## Nil performance benefits of defragmentation in index.
https://stackoverflow.com/questions/48569979/mariadb-table-defragmentation-using-optimize
```

3. Defragmentation

```
## Optimize table
ALTER TABLE contributions engine = InnoDB # Das gleiche wie OPTIMIZE TABLE

## mariadb has a patch for defragmentation
https://mariadb.org/defragmenting-unused-space-on-innodb-tablespace/

## alter table xyz engine=InnoDB - defragmentations
## but is also invasive.
## with ibdata1 innodb_file_per_table it lets the size grow
```

4. Is it possible to do select, update, deletes without using innodb_buffer in specific

No, this is not possible

8. MariaDB (Features/Vorteile)

- flashback
- Verschlüsselung von Tabellen // mariabackup
- Einige Storage Engine (Aria -> MyISAM - crash-recovery)
- JSON anders implementiert
- galera
- feature: defragmentation

MySQL 8 does not:
 decode
 set profiling (still available but deprecated)

9. Select without locking

```
SET TRANSACTION ISOLATION LEVEL READ UNCOMMITTED ;
BEGIN ;
SELECT * FROM TABLE_NAME ;
COMMIT ;
```

Projektarbeit/-optimierung

Praktisch Umsetzung in 3-Schritten

Schritt 1: Hardware

- 1) Arbeitsspeicher erhöhen/nachkaufen und mindestens 50% der Nutzdaten
- 2) Extra Maschine für Applikation und für Datenbank (möglichst gute Anbindung untereinander)
 d.h. Maschinen stecken am besten gleichen Serverschrank

Schritt 2: Konfiguration

1. [Optimierung des InnoDB Buffers - Größe](#)

2. [innodb_flush_log_at_trx_commit](#) auf 0 setzen (jede Sekunde statt bei jedem Commit)

Schritt 3: Optimierung der Anfragen

1. [Vorbereitung Ausgabe Slow Log für die Analyse](#)
2. [Installation percona-toolkit](#)
3. [Analyse slow-log-file mit pt-query-digest](#)
4. Analyse langsamer Queries mit explain und Index setzen
 - [Explain inkl. JSON-Format](#)
 - [Index setzten - Teil 1](#)
 - [Index und Joins](#)
 - [Function in Wheres vermeiden](#)
 - [Workaround für Funktionen - Virtual Column](#)

Extra: Der Ausweg bei großen Tabellen

1. Falls es keine andere Lösung gibt, könnte u.U. Partitionierung helfen. [Hier](#)
